

Chrome Security Guide

There is a demo html file in this folder which demonstrates making a request to the MSF API directly from the client. For this file to function correctly you will need to disable security in chrome. Close all instances of chrome then run one of the following commands.

For windows create a chrome shortcut and add these arguments.

```
--user-data-dir="C:/Chrome dev session" --disable-web-security
```

For OSX run this command in the terminal.

```
open -a Google\ Chrome --args --disable-web-security
```

For Linux run this command in the terminal.

```
google-chrome --disable-web-security
```

Next edit the demo file to add your own authorization details to the header from the login and password you have been given. Instructions can be found in the MSF_Documentaion file under authentication.

Open the demo file in chrome and then open your console and you should see some data!
